Date: 2023-09-22

Aim:

Write a java program to demonstrate operator precedence and associativity Source Code:

```
OperatorPrecedence.java
import java.util.Scanner;
class OperatorPrecedence{
       public static void main(String[] args){
               int x,result;
               System.out.print("Enter a num: ");
               Scanner sc=new Scanner(System.in);
               x=sc.nextInt();
               result=x++ +x++*--x/x++ - --x+3>>1 | 2;
               System.out.println("The operation going is x++ + x++ * --x / x++ --
-x + 3 >> 1 | 2");
               System.out.println("result = "+result);
        }
}
```

Execution Results - All test cases have succeeded!

```
Test Case - 1
User Output
Enter a num:
The operation going is x++ + x++ * --x / x++ - --x + 3 >> 1 | 2
result = 3
```

```
Test Case - 2
User Output
Enter a num:
The operation going is x++ + x++ * --x / x++ - --x + 3 >> 1 \mid 2
result = 2
```

ID: 224G1A0542 Page No: 1

write a java program that uses if-else control statement and print the result

Source Code:

```
Control.java
import java.util.Scanner;
class Control{
        public static void main(String args[]){
               int x,y,z;
               Scanner sc = new Scanner(System.in);
                System.out.print("Enter first num : ");
                x=sc.nextInt();
                System.out.print("Enter second num : ");
               y=sc.nextInt();
                z=x+y;
               if(z<20){
                       System.out.println("x + y is less than 20");
               }
               else{
                       System.out.println("x + y is greater than 20");
               }
        }
```

Execution Results - All test cases have succeeded!

```
Test Case - 1
User Output
Enter first num :
Enter second num :
x + y is less than 20
```

```
Test Case - 2
User Output
Enter first num :
Enter second num :
10
x + y is greater than 20
```

Exp. Name: Sample Program to demonstrate S.No: 3 Date: 2023-09-22 constructor

Aim:

Write a program to demonstrate constructor class

Source Code:

```
Student.java
class Student{
        int num;
        String name;
        //method to display the value of num and name
        void display(){
        System.out.println(num+" "+name);
        public static void main(String args[]){
        //creating objects
        Student s1=new Student();
        Student s2=new Student();
        //displaying values of the object
        s1.display();
        s2.display();
        }
}
```

Execution Results - All test cases have succeeded!

```
Test Case - 1
User Output
0 null
0 null
```

ID: 224G1A0542 Page No: 3

Date: 2023-09-22

Aim:

Write a program to demonstrate destructor class

Source Code:

```
DestructorExample.java
public class DestructorExample{
        public static void main(String args[])
{
               DestructorExample de=new DestructorExample();
               de.finalize();
                de=null;
                System.gc();
                System.out.println("Inside the main() method");
}
        protected void finalize()
                System.out.println("Object is destroyed by the Garbage Collector");
        }
}
```

Execution Results - All test cases have succeeded!

Test Case - 1 **User Output** Object is destroyed by the Garbage Collector Inside the main() method Object is destroyed by the Garbage Collector

Write Java program on use of Inheritance.

Create a classVehicle

- contains the data members **color** of String type and **speed** and **size** of integer data type.
- write a methodsetVehicleAttributes() to initialize the data members

Create another classCarwhich is derived from the classVehicle

- contains the data membersccandgearsofintegerdata type
- write a methodsetCarAttributes() to initialize the data members
- write a methoddisplayCarAttributes() which will display all the attributes.

Write another class InheritanceDemo with main() it receives five arguments color, speed, size, cc and gears. Source Code:

InheritanceDemo.java

ID: 224G1A0542 Page No: 14

Execution Results - All test cases have succeeded!

b1.setCarAttributes(args[0],args[1],args[2],args[3],args[4]);

import java.util.Scanner;

class Car extends Vehicle

int CC; int gears;

}

}

public class InheritanceDemo{

String color; int speed; int size;

color = c;

void setVehicleAttributes(String c,String s,String sp){

void setCarAttributes(String c,String s,String sp,String cce,String gear){

speed = Integer.parseInt(s); size = Integer.parseInt(sp);

setVehicleAttributes(c,s,sp); CC = Integer.parseInt(cce); gears = Integer.parseInt(gear);

System.out.println("Color of Car : "+color); System.out.println("Speed of Car : "+speed); System.out.println("Size of Car : "+size); System.out.println("CC of Car : "+CC);

System.out.println("No of gears of Car : "+gears);

displayCarAttributes();

public static void main(String args[])

Car b1 = new Car();

void displayCarAttributes(){

class Vehicle {

```
Test Case - 1
User Output

Aim:

write a java program to prevent inheritance using abstract class.

- Create an abstract class Shape
- Create a class Rectangle which extends the class Shape
- Class Rectangle contains a method draw which prints drawing rectangle
- Create another class circle1 which extends Shape
- · Class circle1 contains a method draw whoih prints drawing circle
- Create a main class TestAbstraction1
- · Create object for the class circle1 and called the method draw

Source Code:

```
TestAbstraction1.java

abstract class Shape {
    abstract void draw();
}
class Rectangle extends Shape{
    void draw(){
        System.out.println("drawing rectangle");
    }
}
class Circle1 extends Shape{
    void draw()
    {
        System.out.println("drawing circle");
    }
}
class TestAbstraction1
{
    public static void main(String args[])
    {
        Shape s=new Circle1();
        s.draw();
    }
}
```

Execution Results - All test cases have succeeded!

```
Test Case - 1

User Output

drawing circle
```

Write a program on method overriding

Source Code:

```
Bike.java
```

Execution Results - All test cases have succeeded!

Test Case - 1

User Output

Bike is running safely

Srinivasa Ramanujan Institute of Technology 2022-2026-CSE-A

ID: 224G1A0542 Page No: 20

Date: 2023-12-03

Aim:

Write a Java program that implements an interface.

Create an interface called Car with two abstract methods String getName() and int getMaxSpeed(). Also declare one **default** method void applyBreak() which has the code snippet

```
System.out.println("Applying break on " + getName());
```

In the same interface include a **static** method <u>Car getFastestCar(Car car1, Car car2)</u>, which returns **car1** if the **maxSpeed** of **car1** is greater than or equal to that of **car2**, else should return **car2**.

Create a class called BMW which implements the interface Car and provides the implementation for the abstract methods **getName()** and **getMaxSpeed()** (make sure to declare the appropriate fields to store **name** and **maxSpeed** and also the constructor to initialize them).

Similarly, create a class called Audi which implements the interface Car and provides the implementation for the abstract methods **getName()** and **getMaxSpeed()** (make sure to declare the appropriate fields to store **name** and **maxSpeed** and also the constructor to initialize them).

Create a public class called MainApp with the main() method.

Take the input from the command line arguments. Create objects for the classes BMW and Audi then print the fastest car.

Note:

Java 8 introduced a new feature called default methods or defender methods, which allow developers to add new methods to the interfaces without breaking the existing implementation of these interface. These default methods can also be overridden in the implementing classes or made abstract in the extending interfaces. If they are not overridden, their implementation will be shared by all the implementing classes or sub interfaces.

Below is the syntax for declaring a default method in an interface :

```
public default void methodName() {
    System.out.println("This is a default method in interface");
}
```

Similarly, **Java 8** also introduced **static** methods inside interfaces, which act as regular static methods in classes. These allow developers group the utility functions along with the interfaces instead of defining them in a separate helper class.

Below is the syntax for declaring a static method in an interface :

```
public static void methodName() {
    System.out.println("This is a static method in interface");
}
```

```
ID: 224G1A0542 Page No: 22
```

```
q11284/MainApp.java
package q11284;
interface Car{
        abstract String getName();
        abstract int getMaxSpeed();
        public default void applyBreak()
                System.out.println("Applying break on "+getName());
        }
        public static Car getFastestCar(Car car1,Car car2)
                if(car1.getMaxSpeed()>=car2.getMaxSpeed())
                        return car1;
                else
                        return car2;
        }
class BMW implements Car {
        String name;
        int speed;
        public BMW(String n,String s){
                speed=Integer.parseInt(s);
                name=n;
        public String getName(){
                return name;
        public int getMaxSpeed(){
                return speed;
class Audi implements Car {
        String name;
        int speed;
        public Audi(String n,String s){
                speed=Integer.parseInt(s);
                name=n;
        public String getName(){
                return name;
        public int getMaxSpeed(){
                return speed;
}
public class MainApp {
        public static void main(String args[]) {
                BMW bmw=new BMW(args[0],args[1]);
                Audi audi=new Audi(args[2],args[3]);
                Car max=Car.getFastestCar(bmw,audi);
                System.out.println("Fastest car is : "+max.getName());
        }
```

Execution Results - All test cases have succeeded!

Test Case - 1

Aim:

Write a Java program to create an exception.

Source Code:

```
q221/Exception1.java
package q221;
public class Exception1
        public static void main(String arg[])
               int d=0;
               try
                {
                       int a=42/d;
               catch(ArithmeticException e)
                       System.out.println("Exception caught : divide by zero
occurred");
               }
```

Execution Results - All test cases have succeeded!

Test Case - 1

User Output

Exception caught : divide by zero occurred

Write a Java code for handling the exception.

Source Code:

```
q222/handleError.java
package q222;
import java.util.Random;
public class handleError {
        public static void main(String args[]) {
               int a = 0, b = 0, c = 0;
                Random r = new Random(100);
                for(int i=0;i<32;i++)
                        try
                                {
                                        b=r.nextInt();
                                        c=r.nextInt();
                                        a=12345/(b/c);
                                catch(ArithmeticException e)
                                        {
                                                System.out.println("Division by
zero.");
                                                a=0;
                                        System.out.println("a: "+a);
                }
        }
}
```

	Test Case - 1
User Output	
a: 12345	
Division by zero.	
a: 0	
a: -1028	
Division by zero.	
a: 0	
a: 12345	
a: -12345	
Division by zero.	

a: 0

S.No: 24	Exp. Name: program to create a super class called Figure that it returns the area of a rectangle and triangle	Date: 2023-11-05
----------	---	------------------

Write a java program to create a super class called Figure that receives the dimensions of two dimensional objects. It also defines a method called area that computes the area of an object. The program derives two subclasses from Figure. The first is Rectangle and second is Triangle. Each of the sub classes override area() so that it returns the area of a rectangle and triangle respectively

Source Code:

AbstractAreas.java

ID: 224G1A0542 Page No: 37

```

S.No: 25 Exp. Name: Write a Java program demonstrating the usage of Threads

Date: 2024-01-03

Aim:

Write a Java program that uses three threads to perform the below actions:

- 1. First thread should print "Good morning" for every 1 second for 2 times
- 2. Second thread should print "Hello" for every 1 seconds for 2 times
- 3. Third thread should print "Welcome" for every 3 seconds for 1 times

Write appropriate **constructor** in the <u>Printer</u> class which implements <u>Runnable</u> interface to take three arguments: **message**, **delay** and <u>count</u> of types **String**, **int** and **int** respectively.

Write code in the Printer.run() method to print the message with appropriate delay and for number of times mentioned in count.

Write a class called ThreadDemo with the main() method which instantiates and executes three instances of the above mentioned Printer class as threads to produce the desired output.

[Note: If you want to sleep for 2 seconds you should call (Thread.sleep(2000);) as the (Thread.sleep(...) method takes milliseconds as argument.]

Note: Please don't change the package name.

User Output	
Good morning	
Hello	
Welcome	
Good morning	
Hello	
All the three threads t1, t2 and t3 have completed execution.	

Exp. Name: Program to find and replace pattern in a given file.

Date: 2024-01-03

Aim:

S.No: 26

Write a java program to find and replace patterns in a given file. Replace the string "This is test string 20000" with the input string.

Note: Please don't change the package name.

Source Code:

```
q29790/ReplaceFile.java
package q29790;
import java.io.*;
import java.util.*;
public class ReplaceFile {
        public static void main(String args[]) {
                        Scanner sc = new Scanner(System.in);
                        String input = sc.nextLine();
                        File file = new File("file.txt");
                        BufferedReader reader = new BufferedReader(new
FileReader(file));
                       String line = "", oldtext = "";
                        while((line = reader.readLine()) != null) {
                                oldtext += line + "\r";
                        reader.close();
                        String newtext = oldtext.replaceAll("This is test string
20000", input);
                        FileWriter writer = new FileWriter("file.txt");
                        writer.write(newtext);writer.close();
                        System.out.print("Previous string: "+oldtext);
                        System.out.print("New String: "+newtext);
                catch (IOException ioe) {
                        ioe.printStackTrace();
        }
}
```

file.txt

This is test string 20000. The test string is replaced with your input string, check the string you entered is now visible here.

Execution Results - All test cases have succeeded!

	Test Case - 1	
User Output

Previous string: This is test string 20000. The test string is replaced with your input string, check the string you entered is now visible here.

New String: New string. The test string is replaced with your input string, check the string you entered is now visible here.

ID: 224G1A0542 Page No: 43

Aim:

Use inheritance to create an exception superclass called Exception A and exception subclasses Exception B and Exception C, where Exception B inherits from Exception A and Exception C inherits from Exception B. Write a java program to demonstrate that the catch block for type Exception A catches the exception of type Exception B and Exception C.

Note: Please don't change the package name.
